SUMMARY

I am an aspiring **AI/ML Engineer** with strong skills in **Python, Machine Learning, Deep Learning, and NLP**. I have hands-on experience building end-to-end ML pipelines, training and evaluating models, and deploying AI-powered applications. I am proficient in **Scikit-learn, TensorFlow, Hugging Face Transformers, and SQL**, and passionate about solving real-world problems through intelligent systems, predictive modeling, and data-driven decision-making.

SKILLS

Programming: Python, R, SQL

Machine Learning & AI: Deep Learning, NLP, LLMs, Model Optimization

Frameworks & Libraries: FastAPI, PyTorch, Scikit-learn, LangChain

Tracking & Document Processing: MLFLOW, PyMuPDF, PyPDF

Databases: SQL, MongoDB, PostgreSQL

Tools: Git, GitHub, Jupyter Notebook, Docker

EDUCATION

University of Mumbai
Bachelor of Data Science

Maharashtra, Mumbai, India
Aug 2022 – Jun 2025

PROJECTS

DocuQuery AI | Python, FastAPI, LangChain, RAG, Chroma, Docker

[\[View on GitHub\]](#)

- Built an **AI-powered document research assistant** using **RAG (Retrieval-Augmented Generation)** architecture enabling users to upload PDFs and query them in natural language with high accuracy.
- Implemented **LangChain** for document parsing, chunking and vector embedding with **Chroma** for semantic similarity search; developed **FastAPI** backend with REST API support for multi-document upload and context-aware Q&A.
- Containerized full application using **Docker** and built **Streamlit** frontend for real-time document querying with AI-generated answers and source references.

JobSalaryPrediction | Python, Random Forest, XGBoost, MLflow, Docker, Render, Streamlit

[\[View on GitHub\]](#)

- Built a **Job Salary Prediction system** using **Machine Learning** models (Random Forest, XGBoost) trained on real-world job listings to predict salaries based on role, experience, location, and skills with high accuracy.
- Integrated **MLflow** for complete experiment tracking — logged model parameters, metrics, and artifacts across multiple runs to compare and select the best performing model for production deployment.
- Containerized the full ML pipeline using **Docker** and deployed on **Render** for public access, enabling real-time salary predictions through an interactive **Streamlit** web application.

Email-spam-detection | Python, NLP, TF-IDF, Naive Bayes, Logistic Regression

[\[View on GitHub\]](#)

- Built an **Email Spam Detection system** using **NLP techniques** — preprocessed email text with tokenization, stop-word removal and **TF-IDF vectorization** to classify emails as spam or not spam.
- Trained and compared **Naive Bayes and Logistic Regression** models on real email datasets, achieving **95% accuracy** with a clean **Streamlit** interface for live email classification.
